# Utah Hospital Utilization and Charges Profile

## Executive Summary

The 2009 hospital discharge database contains data on all hospitalizations from 53 Utah hospitals, which include 41 general acute care hospitals, three psychiatric hospitals, eight specialty hospitals, and the Veterans Administration Medical Center. With 18 years of data now available (1992-2009), it is possible to assess trends in health care utilization, quality, and access to hospital care. The annual Utah Hospital Utilization and Charges Profile is a compilation of statewide and hospital summary statistics for inpatient discharges occurring from January 1, 2009, to December 31, 2009. This profile was designed to meet the needs of the hospital industry for market comparisons. Other types of hospital data are available in a variety of formats and data products from the Office of Health Care Statistics:

Internet tables and databases: <http://health.utah.gov/hda>

Public Data Set (single year or multiple year data on CD-ROM)

Research-oriented Data Set

Hospital comparison reports: <http://health.utah.gov/myhealthcare/hospital.htm#sb132>

Reports based on the All Payer Claims Database: <http://utahatlas.health.utah.gov/>

### 2009 Highlights

- Four tenths (39.5%) of all discharges were maternity or newborn related and accounted for 14.6% of total facility charges.
- Surgeries for all ages comprised one quarter (24.3%) of all discharges and accounted for half (51.4%) of total facility charges.
- Medical cases for all ages comprised one third (31.3%) of all discharges and accounted for just over one fourth (29.2%) of the total facility charges.
- Discharges with the lowest average charge were normal newborns (DRG 391). Average charge was \$1,911 and average length of stay was 1.85 days.
- Among discharges with higher average charge for newborns were extreme immaturity/respiratory distress syndrome (DRG 386). Average charge was \$73,506 and average length of stay was 22.0 days.
- Other cases with higher average charges included cardiac and coronary cases (DRG 104). Average charge was \$121,063 and average length of stay was 11.5 days.
- ECMO/Tracheostomy Excluding Mouth, Larynx, Pharynx (DRG 541) was the highest with an average charge of \$295,971 and average length of stay was 29.5 days.
- For type of admissions, half (48.8%) of discharges were emergency or urgent admissions.
- For source of admissions, less than half (39.7%) were admissions by physician referral, and an additional quarter (27.4%) were admissions from emergency departments.
- For one third (32.9%) of discharges, managed care was the primary payer, followed by Medicare (19.5%) and Medicaid (18.6%). CHIP and charity were primary payers for 1.6% of discharges.
- Total hospital charges<sup>1</sup> increased 8.8% from 2008 to 2009, compared to 10.3% from 2007 to 2008, 10.1% from 2006 to 2007, and 14.9% from 2002 to 2003, the largest annual increase since 2000. The average length of stay (4.0 days) in 2009 has not changed significantly since 1998.

<sup>1</sup> Charges do not reflect actual costs. Cost and payment information is not currently available from hospitals.

---

## Trend Highlights

For newborn and maternal discharges, surgical and medical discharges, the percentage of the charges for these categories have been stable over the past seven years. However, for some specific DRGs, the state average charge has increased, even when length of stay is considered. The following examples illustrate less expensive and more expensive inpatient care scenarios

- For normal newborn (DRG 391), the state average charge has increased from \$917 in 1999 to \$1,911 in 2009, an increase of 108%, with a slight increase in average length of stay in the hospital from 1.7 days to 1.85 days. The average charge per day increased from \$539 to \$1,033, an increase of 92% (see Figure 1).
- The state average for newborn with extreme immaturity, respiratory distress syndrome (DRG 386) has varied, possibly due to relatively small annual numbers of these infants. However, the state average charge per day has increased from \$2,178 in 1999 to \$3,346 in 2009, an increase of 54% (see Figure 2).
- For cardiac and coronary care (DRG 104), the state average per hospital stay has increased from \$66,561 in 1999 to \$121,063 in 2009, an increase of 82%, while average length of stay ranged from 10 through 13 days. The average charge per day has increased from \$6,656 in 1999 to \$10,527 in 2009, an increase of 58% (see Figure 3).
- For bone marrow transplant (DRG 481), the state average per hospital stay has increased from \$136,786 in 1999 to \$177,249 in 2009, an increase of 30% since 1999 while average length of stay ranged from 24 through 32 days. The average charge per day has increased from \$4,800 in 1999 to \$6,543 in 2009, an increase of 36%.
- For ECMO/Trachostomy Excluding Mouth/Larynx/Pharynx (DRG 541), the state average per hospital stay has increased from \$161,915 in 1999 to \$295,971 in 2009, an increase of 83%, while average length of stay ranged from 31 through 40 days. The average charge per day has increased from \$4,364 in 1999 to 8,595 in 2009, an increase of 130%.
- Emergency Department as the source of admission has increased from 21.7% in 1999 to 27.4% in 2009.
- Physician Referral has decreased from 51.2% in 1999 to 39.7% in 2009.
- By health care payer, the percentage for managed care has decreased from 40.1% in 1999 to 32.9% in 2009.
- Medicaid has nearly doubled as a payer, increasing from 9.5% in 1999 to 18.5% in 2009.

---

# Introduction

## The Health Data Committee

Chapter 33a, Title 26, Utah Code Annotated established the thirteen-member Utah Health Data Committee (committee). In accordance with the act, the committee's purpose is —

*“to direct a statewide effort to collect, analyze, and distribute health care data to facilitate the promotion and accessibility of quality and cost-effective health care and also to facilitate interaction among those with concern for health care issues.”*

## The Health Data Plan

The committee worked with numerous organizations and individuals to develop the *Utah Health Data Plan*, which defines the implementation of a statewide health data reporting system. The committee realizes the need for information is great, but recognizes resources are limited so its activities must be prioritized.

The committee's first priority is inpatient hospital discharge data. According to statistics released by the Division of Health Care Financing, Utah Department of Health, hospital care accounted for 38 percent of total Utah health care expenditures in 1998. Additionally, hospital billing data was identified as a readily available data source which was comparable across hospitals at a state, regional, and national level.

Current committee priorities include measurement and evaluation (HEDIS and satisfaction surveys), and ambulatory surgery data from hospitals and freestanding ambulatory surgery facilities.

## The Hospital Discharge Database

Administrative Rule R428-10 became effective December 1991, and mandated that all Utah licensed hospitals, both general acute care and specialty, report information on inpatient discharges. Since 1992, the Office of Health Care Statistics has collected a wealth of information from the 63 Utah hospitals that have submitted data. To date, some of these hospitals have closed or been renamed. For 2009, 53

hospitals submitted inpatient discharge data. These hospitals include 41 general acute care facilities, three psychiatric facilities, eight specialty hospitals and the Veterans Administration Medical Center. Shriners Hospital, a charity hospital, has been exempt from reporting requirements; and Utah State Hospital, a psychiatric hospital, became exempt from reporting beginning in 1996.

**The Utah Hospital Inpatient Discharge Data Standard Report (ST-1) is an annual report from the inpatient hospital discharge data released by the Utah Health Data Committee. The ST-1 data serves as the basis for smaller, consumer oriented reports. The hospital discharge data will also be used to support evaluation and monitoring of annual hospital utilization trends.**

All hospitals report “discharge data” for each inpatient served. “Discharge data” means the consolidation of complete billing, medical, and demographic information describing a patient, the services received, and charges billed for each inpatient hospital stay.

Discharge data records are submitted to the office quarterly. The data elements are based on discharges occurring in a calendar quarter. If a patient has a bill generated during a quarter, but has not yet been discharged by the end of the quarter, data for that stay is not included in the quarter's data.

## Data Submission

The committee receives discharge data quarterly from hospitals in various formats and media. All of the unaffiliated small rural hospitals now submit data in electronic format, while some of the psychiatric hospitals submit hard copies of UB-92 forms. Discharges from affiliated hospitals are submitted in electronic format by the corporate office (i.e. IHC, MountainStar, etc.). Discharge data are converted into a standardized format by the Office of Health Care Statistics as specified in the *Utah Health Data Plan*.

## System Edits

Data are validated through a process of automated editing and report verification. Each record is subjected to a series of edits that check for accuracy, consistency, completeness, and conformity with the definitions specified in the Technical Manual. Records failing

---

the edit check are returned to the data supplier for correction or comment.

## About This Report

The tables contained in this report present many of the factors within a hospital which drive the costs of patient care. The major issues addressed by these documents include:

1. volume and intensity of inpatient health care,
2. differences in inpatient services,
3. differences in patient demographics and complexity among hospitals.

Consumers, employers, payers, policy-makers, and providers can utilize these documents to plan for resource allocation, identify geographic areas of public concern, weigh purchasing decisions, and make peer comparisons. Purchasers may use the information to select providers and payers, or to tailor benefit offerings.

### Organization of this Report

The 62 DRGs shown in this report were selected based on the statewide volume of discharges and sum of total charges. These DRGs collectively account for at least 60% of the total inpatient volume or at least 60% of all total charges.

This report presents the distribution, composition, and outcome measures of inpatient discharges by selected characteristics. The information is broken down by hospital and arranged according to peer groups in the sequence listed above. Where it is appropriate,

comparative statistics are shown for the hospital's peer group by state. Each hospital table is in four parts:

**ST 1-1** - Hospital discharges and facility charges by type of clinical services and major diagnostic category (MDC).

**ST 1-2** - Summary statistics for facility charges and length of stay, overall and for 62 selected diagnosis related groups (DRG).

**ST 1-3** - Summary statistics for facility charges and length of stay for 27 selected all patient refined diagnosis

related groups (APR-DRG) with patient severity levels.

**ST 1-4** - Patient profile: gender, age, type of admission, source of admission, discharge status, primary payer category and patient origin by local health district.

### Description of Table Entries

Using health care data to impact decision making requires a commitment on the part of and type of user to understand the complex nature of health care. Decision making is not simple and cannot be reduced to a single indicator. Committee resource documents should serve as screens for the further analysis of provider selection, rather than devices that provide the final answer. The entries in the following tables will assist the users in interpreting the information. Additional definitions of terms used in this report are in Appendix B.

---

**Discharges** - Number of inpatient discharges that occurred during the period from January 1, 2009 to December 31, 2009.

**Total Charges** - Sum of all charges included in the billing form, including both facility charges and professional fees and patient convenience items. This is different from *cost* of treatment or *payment* received by the hospital.

**Facility Charges** - Sum of all charges related to using a facility. Facility charge is calculated by subtracting professional fees and patient convenience item charges from total charge.

**Type of Service:**

*Live born infants* - Patients with principal diagnosis code ICD-9 V30-V39 (Live born infants).

*Obstetric* - Patients assigned to Major Diagnostic Category (MDC) 14 (Pregnancy, Childbirth, & the Puerperium).

*Pediatric* - Patients age 0-17, excluding newborns.

*Medical or Surgical* - Patients are considered surgical if they had a procedure performed which would require the use of the operating room and considered medical otherwise. The classification was determined from the DRG.

*Psychiatric* - Patients assigned to MDC 19 (Mental Diseases and Disorders).

*Rehabilitation* - Patients assigned to DRG 462 (Rehabilitation).

**Major Diagnostic Categories** - Mutually exclusive principal diagnosis categories, from which DRGs are formed. The diagnoses in each MDC correspond to a single organ system or etiology and in general, are associated with a particular medical specialty.

**Adjusted Average Charge** - Average charge for a hospital divided by the hospital's case-mix index and excluding outliers.

**Outlier** - See "*Outlier Cases*" below.

**Gender** - Gender of patient.

**Age** - Derived from dates of birth and discharge.

**Type of Admission:**

*Emergency* - The patient requires immediate medical intervention as a result of severe, life threatening or potentially disabling conditions. Generally, the patient is admitted through the emergency room.

*Urgent* - The patient requires immediate attention for the care and treatment of a physical or mental disorder. Generally, the patient is admitted to the first available and suitable accommodation.

*Elective* - The patient's condition permits adequate time to schedule the availability of a suitable accommodation. An elective admission can be delayed without substantial risk to the health of the individual.

*Newborn* - Use of this code necessitates the use of a special source of admission codes, see Source of Admission below. Generally, the child is born within the facility.

*Trauma Center* - Visits to a trauma center/hospital as licensed by or authorized by the State to be a trauma center.

**Sources of Admission:**

*Physician Referral* - The patient was admitted to this facility upon the recommendation of his or her personal physician not affiliated with a health maintenance organization (HMO).

*Clinic Referral* - The patient was admitted to this facility upon recommendation of this facility's clinic physician.

*HMO Referral* - The patient was admitted to this facility upon the recommendation of an HMO physician.

*Transfer from a hospital* - The patient was admitted to this facility as a transfer from an acute care facility where he or she was an inpatient.

---

*Transfer from a skilled nursing facility* - The patient was admitted to this facility as a transfer from a skilled nursing facility where he or she was an inpatient.

*Transfer from another health care facility* - The patient was admitted to this facility as a transfer from a health care facility other than an acute care facility or skilled nursing facility.

*Emergency Department* - The patient was admitted to this facility upon the recommendation of this facility's emergency room physician.

*Court/Law enforcement* - The patient was admitted to this facility upon the direction of a court of law, or upon the request of a law enforcement agency representative.

*Normal delivery* - A baby delivered without complications.

*Premature delivery* - A baby delivered with time or weight factors qualifying it for premature status.

*Sick baby* - A baby delivered with medical complications, other than those relating to premature status.

*Extramural birth* - A baby born in a non-sterile environment.

#### **Multi-County Local Health District:**

*Bear River* - Including Box Elder, Cache and Rich counties

*Central Utah* - Including Juab, Millard, Piute, Sevier, Wayne, Sanpete counties

*Southeastern Utah* - Including Carbon, Emery, Grand, and San Juan counties

*Southwest Utah* - Including Garfield, Iron, Kane, Washington, and Beaver counties

*TriCounty (Uintah Basin)* - Including Daggett, Duchesne, Uintah counties

*Weber-Morgan* - Including Weber and Morgan counties

#### **Limitations**

This report shows total billed charges, which includes both facility charge and professional charge. Billed charges are to be used as only one indicator of hospital performance. All patients, or insurance plans, do not pay the same amount for similar treatments, supplies, services, and procedures, even though they may be billed the same amount. Hospitals offer a variety of contracts, many with discount arrangements based on volume. Because of this, the data reflects pre-contractual prices for hospitalization and not the actual payment between providers and payers.

This report can be used to compare broad measures of utilization for all hospitals, but more detailed data are needed to look at specific performance comparisons between hospitals. It addresses inpatient utilization issues, but does not directly measure the quality of medical care. This information serves as an important first step toward consumers' taking a more active role in health care decision-making.

The price of hospital services, while important, is not the only consideration in making inpatient hospital decisions. Other factors that may influence hospital services, including: the type of condition treated, the physicians who practice at the hospital, and the insurance company's managed care policies. The subscriber should be familiar with his or her health plan long before hospital care is needed. (For additional information on managed care performance, please contact the Office of Health Care Statistics at (801) 538-7048.)

---

# Sources of Hospital Variation In Volume and Outcome of Charges

Users of this report must remember that several factors such as volume of patients discharged, coding inconsistencies, and severity of patient illness can influence inter-hospital comparisons. In interpreting the information shown in this report, the reader is advised to keep in mind the following:

## **Volume**

If a hospital discharged only a few types of certain cases, comparing data with other hospitals would not be especially meaningful because a small number of cases are not sufficient to establish a pattern of treatment. The reader must exercise caution when interpreting measures shown in this report that were based on less than five discharges.

## **Coding**

Inter-hospital variations may be a reflection of the differences in coding practices and quality of data. From the beginning, the committee worked to assure the best data quality possible. To do so, they implemented the following:

1. The Health Data Plan provides data element definitions and standards to ensure all hospitals will report similar data.
2. Systematic edits were put in place to identify missing or invalid data fields and hospitals are required to correct these.
3. Each hospital is provided with a 35-day review period to validate the committee's data against their hospital records.

Despite the detailed edit and validation process, data quality is still an issue but is expected to improve over time as hospitals become accustomed to reporting data for public dissemination. Any comparative analysis or decision-making, based on this data, should take into account issues of data quality.

## **Severity of Illness**

Patients entering hospitals for the same treatment and conditions often vary in the severity of their illnesses. Factors such as age, gender, and secondary illnesses account for differences in severity. Treating severely-ill patients is the most resource intensive and expensive. For instance, patients who are the sickest may need to be admitted to intensive care units, may need high-technology equipment, or may need to stay longer in hospitals than those less ill patients.

Some hospitals, especially regional referral centers such as Primary Children's Hospital and LDS Hospital, treat more acutely ill patients because of the specialized care available at their facility. The University of Utah hospital, which serves as a regional referral center as well as a major teaching hospital, treats more patients with complex medical conditions than other hospitals. Charges for patients cared for at these hospitals may be higher than at other hospitals due to the type of services offered and the type of patients served.

Rural hospitals often admit a mix of patients that may be chronically ill, uninsured, or elderly. The elderly are often more severely ill because of chronic and multiple health problems.

[The remaining sections are derived from comparative performance of U.S. Hospitals: *The Source book, 1992*, Health Care Investment Analysts, Inc. (HCIA).]

## **Size**

Larger hospitals typically provide a more extensive array of services, including many not found in smaller hospitals, that are more sophisticated and resource-intensive, such as specialized intensive care units. The provision of more extensive and sophisticated services typically entails the need for more complex diagnostic and therapeutic equipment, which often requires additional personnel with advanced training. As a result, in

---

addition to the standby costs of maintaining a broader scope of services, larger hospitals generally treat a more complex and severely ill mix of patients. That is, the services that large hospitals produce are different in nature from those produced by small ones.

Furthermore, larger hospitals are more likely to be located in urban areas, which tends to increase costs. Finally, larger hospitals more frequently engage in the provision of graduate medical education and research which results in additional direct and indirect costs not incurred by smaller, nonteaching hospitals.

In contrast to the higher unit operating costs, larger hospitals do enjoy a number of advantages over smaller hospitals. As a result of their scope of services, teaching programs, and prestige, larger hospitals are better able to attract patients and physicians than smaller hospitals, and the quality of care they provide are perceived as being higher. Furthermore, the sicker patients for whom they care are less able to postpone care, compared with the patients of small hospitals. That is, a smaller proportion of their patients are elective admissions.

### **Location**

Urban hospitals, compared with rural ones, have higher costs and revenues for a variety of reasons. The most important effect that urban or rural location has on a hospital is on the cost of labor. Hospitals in urban labor markets must typically pay more to employ nurses, administrators, hospital-based physicians, and nearly all other hospital personnel. Primarily because urban hospitals tend to be larger, but also because urban hospitals are faced with greater competition, they generally offer a broader scope of more sophisticated services than do rural hospitals. As a result, urban hospitals generally treat patients requiring more complex care, which further increases their costs compared with rural hospitals and inner-city urban hospitals tend to treat a patient mix that is disproportionately poor or elderly compared with suburban hospitals, which tends to increase their costs.

### **Teaching Status**

Teaching hospitals are those that provide medical education, primarily graduate medical education. The commitment to providing graduate medical education can range from the maintenance of one or more

graduate residency programs approved by the American Medical Association, to the more extensive offerings of larger institutions that are either directly affiliated with a medical school or are members of the Council of Teaching Hospitals.

The most prominent differences between teaching and nonteaching hospitals occur as a result of the contemporaneous provision of teaching and patient care. Teaching hospitals incur certain costs directly associated with medical education programs, the largest category being the salary and benefits expense for interns and residents. Furthermore, the process of educating interns, residents, and other medical trainees normally results in longer lengths of stay and the use of more ancillary services, since students most often learn treatment protocols through practice. As a result, an additional category of costs incurred by teaching hospitals is the “indirect” costs of graduate medical education.

The second major difference between teaching and nonteaching facilities is the broader and more complex scope of services offered by teaching hospitals. Teaching hospitals more frequently operate several intensive care units (which are often specialized), possess the latest medical technologies, and attract a diverse group of physicians representing most specialties and many sub-specialties. Major teaching hospitals also offer many unique tertiary-care services not found in other institutions, such as burn care, shock trauma, and helicopter transport services. As a result of the sophisticated service offerings and types of physicians who practice in teaching hospitals, they attract more severely ill patients, who frequently have more complicated diagnoses or are in need of more complex procedures.

It is commonly believed that, even within fairly narrow diagnostic categories, such as the Medicare DRGs, the severity of illness of patients treated at teaching facilities is greater than that at nonteaching hospitals. As a result of the greater case mix complexity of teaching hospitals, greater amounts of resources are required to provide treatment. Moreover, the offering of many specialized services, such as neonatal intensive care and magnetic resonance imaging, necessarily entails the presence of unused and costly standby capacity.

---

As a result of their teaching programs, more sophisticated service offerings, more complex case mix, and other additional costs, revenues and expenses per discharge are generally significantly higher in teaching hospitals.

## Strategies to Improve Comparability

### **Diagnosis Related Group (DRG)**

The DRGs were developed for the Health Care Financing Administration as a patient classification scheme which provides a means of relating the type of patients a hospital treats (i.e., its case mix) to the costs incurred by the hospital. While all patients are unique, groups of patients have common demographic, diagnostic and therapeutic attributes that determine their resource needs. All patient classification schemes capitalize on these commonalities and utilize the same principle of grouping patients by common characteristics.

The use of DRGs as the basic unit of payment for Medicare patients represents a recognition of the fundamental role a hospital's "sicker" patients play in determining resource usage and costs, at least on average.

"The DRGs, as they are now defined, form a manageable, clinically coherent set of patient classes that relate a hospital's case mix to the resource demands and associated costs experienced by the hospital." (*Diagnosis Related Groups, Seventh Rev., Definitions Manual*, page 15.)

Each discharge in the Utah Health Discharge Database (UHDDDB) was assigned into a DRG based on the principal diagnosis, secondary diagnoses, surgical procedures, age, sex, and discharge status of the patient. This report includes 62 selected DRGs which covered about 60% of all discharges that occurred in 1996, when this report was first published.

### **All-patient Refined (APR)-DRG**

The APR-DRGs are a patient classification scheme developed by 3M Health Information Systems that follows the basic DRG methodology of classifying patients into disease categories, but further subdivides each disease category into severity of illness classifications. With a few exceptions, a patient in each disease category (called consolidated DRG) is assigned into one of four levels of severity: no/minor complication or co-morbidity (CC), moderate CC, major CC, and extreme CC. Some of the exceptions to the four-level classification are newborns and neonates which are assigned to APR-DRGs formed with the severity of condition already built-in (e.g., APR-DRG 590: Neonate, birthweight <750g with major procedure). A significant revision of the APR-DRG classifications occurred July, 2003. This 2009 report attempts to match as closely as possible the APR-DRGs used in earlier reports.

APR-DRG categories were used to define charge and length of stay outliers and calculate the Case Mix Index (See CASE MIX INDEX). For this report, the 3M APR-DRG Grouper software Version 26.1 (October 2008) was run through Third Quarter 2009 data and Version 27.0 (October 2009) was run for Fourth Quarter 2009 data.

This report includes 27 APR-DRGs which covered about 60% of all discharges that occurred in 1996, when this report was first published.

---

## **Outlier Cases**

Some patients have exceptionally low or high lengths of stay (LOS) or total facility charges. A hospital's charges can be affected by just a few unusually long (or short) or expensive (or inexpensive) cases. These high or low values could be a result of coding or data submittal errors, particularly in length of stay, total charges, or data elements that affect DRG assignments. Other reasons for exceptionally low LOS or charges could be due to death or transfer to another facility. Exceptionally high LOS or charges could be due to a catastrophic condition. Whatever the reason, these values, referred to as "outliers," distort the averages and were excluded from calculations. LOS or facility charge high outliers are defined in this and succeeding reports as values above 2.5 standard deviations from the mean. Means and standard deviations are APR-DRG specific and calculated on a statewide basis. The low outliers were defined as a non-newborn or non-normal delivery discharge with less than a \$300 charge. However, the calculations in this report do not exclude low outliers. A preliminary analysis showed that of the discharges that met this definition, a high proportion are in the DRG, "Other factors influencing health status," for which it was difficult to determine whether they were true outliers.

## **Case-Mix Index**

An important source of variation among hospitals in summary measures of outcome - such as length of stay, total charges, and severity of illness - is the differences in the complexity of the patients they treat. To allow for a meaningful comparison of outcome measures among hospitals, an adjustment factor based on patient complexity should be applied. For this reason, four case-mix indices (all-patient, acute, obstetric, and pediatric) have been calculated for each hospital and are shown on the tables in this report. A hospital's case-mix index of 1.15 means that the overall case mix of a hospital requires 15 percent greater intensity of resource use relative to the state as a whole. See Appendix B for a description of the calculation of the case-mix indices.

## **Hospital Peer Groups**

Comparing summary outcome measures (length of stay, total charges, readmission rates, mortality

rate) among hospitals has always been a controversial issue because of the difficulty of defining what makes hospitals comparable. As discussed previously, summary outcome measures vary among hospitals depending on various factors such as location, bed size, ownership, affiliation, and teaching status. If all these factors were to be considered in defining peer groups, each hospital might end up in a group by itself.

The question then, is why define peer groups at all? The answer is that given hospital-level data, users tend to compare hospitals. Without peer groupings to refer to, readers would compare a hospital with either the state level data or to another arbitrarily chosen hospital.

Therefore, it was decided that this report would contain summary statistics for a hospital's peer group as well as for the hospital and the state. Having decided this, the next issue was the basis for the grouping, which is discussed next.

Among various factors which affect a hospital's average charges, location and case mix indicators play important roles in determining the complexity of patients treated in the hospital. Therefore, the bases for the 1993 hospital grouping are location (urban/rural) and the all-patient case-mix index, except for psychiatric and substance abuse hospitals and non-comparable hospitals.

The hospitals are assigned to peer groups according to 1996 UHDDDB acute case-mix index (CMI). See Appendix E for hospital peer groups and CMIs for 2000 through 2009.

Some industry experts contend that hospital comparisons are meaningful only when confined to a specific treatment, service or procedure. Thus, in analyzing total charges for Coronary Artery Bypass (CAB), one would only compare among hospitals that perform CAB. Among these hospitals, a logical peer grouping would be based on the volume and severity mix of discharges associated with this procedure. While this is obviously ideal, it would not be possible in a summary report such as this to define various peer groupings according to different procedures. However, the report contains information on the top 62 DRGs which can be used by the user to form hospital groupings appropriate for a particular analysis.

---

# Additional Information

## **Future Reports**

The ST-1 report contains a wealth of data and serves as the basis for several consumer-friendly reports. These reports will be published and distributed to a broad range of audiences.

## **Internet**

The ST-1 reports are available on the Internet from 1993 through 2009 on <http://health.utah.gov/hda/report/inpatient.php>. You may perform descriptive analyses of inpatient discharge data on the home page <http://health.utah.gov/hda> using the “Query Databases” link. Alternatively, you may use the IBIS Query System on <http://ibis.health.utah.gov> to query inpatient discharge data as well as other kinds of data.

Availability of the Hospital Discharge Database  
Patient-level data are also available in electronic form  
(See Appendix C).

---

## Appendix A

### Case-Mix Index

The case-mix indices were derived as follows:

1. Calculate relative weight for each APR-DRG i:

$$W_i = \frac{C_i}{C_s}$$

where

i = APR-DRG i

s = State level

$W_i$  = Relative weight for APR-DRG i

$C_i$  = Average charge for APR-DRG i

$C_s$  = Average charge for all patients

2. Calculate case-mix index for hospital j:

$$I_j = \frac{\sum_i W_i N_{ij}}{N_j}$$

where:

j = Hospital j

$I_j$  = Case-mix index for hospital j

$N_{ij}$  = Number of discharges for  
APR-DRG i and hospital j

$N_j$  = Total discharges for hospital j

In the calculation of the all case-mix indices, the following were excluded: higher outliers and discharges from psychiatric and substance abuse hospitals, Cache Valley Specialty Hospital, South Davis Community Hospital, HealthSouth Rehabilitation Hospital of Utah, Promise Hospital of Salt Lake, The Orthopedic Specialty Hospital, University of Utah Huntsman Cancer Institute, University of Utah Orthopedic Center, Utah Valley Specialty Hospital, Veterans Administration Medical Center, and Utah State Hospital. Besides the above exclusions, the discharges included in each of case-mix indices are described below:

**Acute Case-Mix Index:** All discharges but excluding Newborns (ICD-9:V30-V39).

**Obstetric Case-Mix Index:** Discharges assigned Major Diagnosis Category (MDC) 14 (Pregnancy, Childbirth, & the Puerperium).

**Pediatric Case-Mix Index:** Patients aged 0-17, excluding newborns.

Only the All-Patient Case-Mix Index is used in this report. The Office of Health Care Statistics can provide the other indexes upon request.

---

~~All Patient Case Mix Index: All discharges~~

## Appendix B

### Definition of Terms Used in This Report

To ensure a common understanding, frequently used terms and measures displayed in the resource documents, and not explained elsewhere in this report, are defined here.

**Severity Adjustment:** An adjustment process to control for confounding in case mix, etiology, and severity among hospital patient populations. Low values imply NOT very sick and high values imply very sick.

**Length of Stay (LOS):** Number of days from the date of admission to date of discharge. If a patient admitted and discharged in the same day this case will be given a length of stay of one day (LOS=1).

**Average Length of Stay (ALOS):** Average length of stay in days, calculated as sum of LOS divided by number of related discharges.

**Average Charge:** Calculated as sum of total charges divided by number of discharges. The average lends itself to further mathematical manipulation (for example, by multiplying it with a projected number of discharges to predict future resource use). Thus it was chosen over other measures, such as the median or mode, neither of which has this statistical property.

**Adjusted ALOS and Charge:** The adjustment process accounts for the differences in reported values among hospitals which can be attributed to the types of patients or illnesses treated at each hospital.

**Chart-Based Severity System:** Severity systems which use clinical data, e.g., laboratory results taken directly from patient medical records, to determine the level of severity of a patient. Clinical information required by chart-based systems is not among the data elements in the Utah Hospital Discharge Database.

**Code-Based Severity System:** Severity systems which utilize information are generally available in a patient's discharge abstract or uniform billing claim form (UB92) instead of using clinical data from patient medical records.

---

## Appendix C

### Electronic Resource Document

**Public Data Sets (PDS)** are available with minimal controls. Different data files are designed to provide general health care data to a wide spectrum of users. Although the data are at the patient level, considerable care has been taken to ensure that no individual patient could be identified from the data. The data elements included in the public use data

- 1 Provider Identifier (Hospital)
- 2 Patient's age (in 5 yr. group)
- 3 Patient's gender
- 4 Type of admission
- 5 Source of admission
- 6 Total days stay
- 7 Patient's discharge status
- 8 Patient's postal zip code
- 9 Patient's residential county
- 10 Patient's cross-county migrant status
- 11 Patient's marital status
- 12 Patient's race
- 13 Patient's ethnicity
- 14 Principal diagnosis
- 15 Secondary diagnosis 1
- 16 Secondary diagnosis 2
- 17 Secondary diagnosis 3
- 18 Secondary diagnosis 4
- 19 Principal procedure
- 20 Secondary procedure 1
- 21 Secondary procedure 2
- 22 DRG
- 23 MDC
- 24 Total charge
- 25 Facility charge
- 26 Professional charge
- 27 Admitting physician specialty
- 28 Attending physician specialty
- 29 Consulting physician specialty
- 30 Surgeon's specialty
- 31 Primary payer category

- 32 Secondary payer category
- 33 Tertiary payer category
- 34 Patient's relationship to insured
- 35 Charge Outlier
- 36 Length of Stay Outlier
- 37 APRDRG
- 38 Patient's Severity Subclass
- 39 Patient's Risk of Mortality
- 40 Discharge Quarter
- 41 Secondary diagnosis code 5
- 42 Secondary diagnosis code 6
- 43 Secondary diagnosis code 7
- 44 Secondary diagnosis code 8
- 45 Secondary procedure code 3
- 46 Secondary procedure code 4
- 47 Secondary procedure code 5
- 48 MS-DRG
- 49 MS-MDC

**Research Oriented Data Set (RODS)** is available through the "Request for Data Release" process outlined in the *Privacy and Confidentiality Policies and Procedures Manual*, Appendix 4 of the *Health Data Plan*. This data set is designed for organized research of a bona fide nature in the health care areas of cost, quality, access, or prevention. The RODS will include more data elements and refined categories in detail than the PDS.

Please send requests for data to:

Office of Health Care Statistics
